The animal is sensitised to a selected antigen by administering the antigen itself or a nucleic acid encoding the antigen, where preferably the antigen is an anaphylactic antigen. The sensitised animal can then be used to screen for compounds which may help to prevent, ameliorate, or cure allergic conditions in humans. The animal model can be used for studying allergic reactions to allergens, such as those in food (peanuts, fruit, berry, nut, bean, milk, dairy products), or in the environment (weed pollen, grass pollen, tree pollen, mite, animal, animal dander, fungal, and insect antigens).

The sequence represents the amino acid sequence of modified anaphylactic antigen Ara h 3, which has been altered to disrupt immunoglobulin E (IgE) binding sites. Ara h 3 is an anaphylactic antigen (A), which was used to design antigenic peptides having a reduced ability to bind IgE as compared with the intact (A), or having a sequence substantially compared with the intact (A), or having a sequence substantially compared that the intact (A), or having a sequence substantially compared in a portion of sequence of an antigen that includes at least one IgE binding site, where at least one IgE binding site of the peptide is altered. The antigenic peptides are used in a composition which is useful for reducing risk or severity of allergic reaction to an antigen, or a familial relationship with an individual who can antigen, or a familial relationship with an individual who compared with a peptide compared with an individual is or basophils in the individual's serum is identified. The individual is contacted with a peptide corresponding to a portion of the antigen, which is selected, formulated, and delivered so that binding of the composition is also useful for treating and
                                                                                                                                                                                                                                                                                                                                                                                                                                 Antigenic fragments useful for reducing anaphylactic risk and reducing the severity and/or number of allergic symptoms in individuals sensitive to antigens, have reduced ability to bind Immunoglobulin E.

Example 3; Page 21-22; 90pp; English.

The invention relates to a non-naturally occurring protein or polypeptide

(I) modified by recombinant DNA techniques comprising: a C-terminal

element comprising an MHC class II-presented epitope; an N-terminal

clement comprising an II-key motif; and an intervening element comprising

a sequence of 4-11 amino acid residues where the modification by

cc ecombinant DNA techniques taking place within elements (b) and (c). Also

described are methods for: suppressing or enhancing an immune response

cd concreted toward an MHC (major histocompatibility complex) Class II
presented epitope of interest. Suppressing an immune response directed

converd an MHC Class II-presented epitope of interest comprises: providing

a nucleic acid sequence encoding the MHC Class II-presented epitope of

interest, the nucleic acid sequence encoding an II-key motif to decrease

cc interest, the nucleic acid sequence encoding the II-key motif to decrease

conformance to the Archetypal II-key regularory motif. Enhancing an

immune response directed toward an MHC Class II-presented epitope of

interest comprises: providing a nucleic acid sequence encoding the MHC

class II-presented epitope of interest, the nucleic acid sequence lacking

cc class II-presented epitope of interest, the nucleic acid sequence lacking

cresidue of the MHC Class II-presented epitope of interest, and modifying

cresidue of the MHC Class II-presented epitope of interest, and modifying

cresidue of interest corresponds to a protein or polypeptide encoded

The structure can be used for improving processability of soya protein. The present amino acid sequence represents the Glycine max (Soybean) var. Dare protein, as described in the specification

The transcribed RNAS from at least two target genes have homology below 90% and the RNA molecule is formed as a single, self-complementary molecule. At least one of the double-stranded structures formed from individual sense sequences has an even number of repeats of 21 or 22 bp. The RNA molecule may include an intron-encoding sequence. At least two target genes are selected from different classes of storage protein genes, i.e. 28-albumen, 78- or 115/128-globulins or zein-prolamine and at least one of the sense sequences is identical to storage
                                                                                                                                                                                                  431
                                                                                                                                                                                                                                                                                                                                     451

procession systems or genes in the name of the system structure measure. Generation of paramacuticals, in biotechnological processes and plant engagemisms are used for engression systems. The RNA of the invention, also related cassettes, expression systems, vectors and transgenic organisms are used for preparation of pharmaceuticals, in blottechnological processes and plant biotechnology, specifically in plants to improve protection against cabiotic stress, to modify camposition and/or content of fatty acids, lipids and oils, to modify carbohydrate composition, to alter colour or pigmentation, to reduce content of storage proteins, to increase content of pathogens, to inhibit stem break, to delay fruit ripening or aging, to induce male sterility, to reduce content of toxic or unwanted components, to modify lignification and/or lignin content, to contents of nicotine, caffeine or theophylline and to increase methionine contents of nicotine, caffeine or theophylline and to increase methionine contents by reducing threonine biosynthesis. The method provides a rapid and efficient way of reducing gene expression, can inhibit more than one transcription rate is the same for all RNA sequences, alguificantly reducing the selection process required to produce an organism with effective suppression of all target genes), avoids problems of epigenic gene silencing, does not require synthesis of individual RNA sequences and the method can be applied to plants with complex (polyploid) genomes:

The invention describes a method of allergen characterisation comprising: obtaining a recombinant fusion protein; attaching the recombinant fusion protein; attaching the recombinant fusion protein at ached to the substrate with a biological sample from an individual; and detecting the binding of immunoglobulin E molecules in the biological sample to the recombinant fusion protein.

Also described are: a method for determining the sensitivity of an individual to a suspected allergen; a method for determining the amount of immunoglobulin E specific for an allergen in a biological sample; a method of immunotherrapy; a method of allergen characterisation; a method for determining the sensitivity of an individual to a suspected allergen; a method of immunotherrapy; a method of allergen characterisation; a method for determining the sensitivity of an individual to a suspected allergen; and instructions for suspend to immunoglobulin E specific for an allergen in a biological sample; a kit comprising the recombinant fusion protein to determine IgE binding to the know or suspected allergen; and a method for epiceminal propedetermination. The method is useful for characterising allergens. This is the amino acid sequence of soybean glycinin G2 acidic protein to that can be used to demonstrate the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 AATCGCATTGAATCAGAGGGCGGTTACATTGAGACTTGGAACCCCAACAACAACAGAGTTC 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for increasing the total oil content of a plant by reducing the amount of at least one storage protein in the plant (or its tissue, organs, parts or cells) and selecting plants that have higher total oil content than starting plants. The storage protein is suppressed by introducing antisense RNA, optionally combined with a ribozyme, sense RNA that induces co-suppression, DNA-binding factors directed against storage protein genes, viral sequences that degrade storage protein RNA, constructs that induce homologous recombination of endogenous storage protein genes or mutations into

storage protein genes. Most preferably a plant cell is stably transfected with a recombinant expression construct, then regenerated to plants that express the incorporated sequence. The expression constructs particularly contain a seed-specific promoter and they are introduced into plants by standard methods, e.g. via Agrobacterium. The preferred storage proteins of the invention are 2S-albumens, 7S or 11S/12S-globulins or zein-production of colls, fats, free fatty acids or their derivatives, useful as foods, animal feeds, pharmaceuticals and fine chemicals. This sequence incorporate a storage protein used to illustrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at twint electronic form from the US patent office at try sequence. However, and the polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomanan, recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stream of the mino acid sequence of a plant full length insert content. This is the amino acid sequence of a plant full length insert increased.
